## Screen Space

- Monitor has some number of pixels
- e.g. $1024 \times 768$
- Some sub-region used for given program
- You call it a window
- Let's call it a viewport instead

## Screen Space

- May not really be a "screen"
- Image file
- Printer
- Other
- Little pixel details
- Sometimes odd
- Upside down
- Hexagonal

## Screen Space

- Viewport is somewhere on screen
- You probably don't care where
- Window System likely manages this detail
- Sometimes you care exactly where
- Viewport has a size in pixels
- Sometimes you care (images, text, etc.)
- Sometimes you don't (using high-level library)

From Shirley textbook.

Remove minus for right-side-up

## Canonical View Space

- Canonical view region
- 2D: $[-1,-1]$ to $[+1,+1]$
- Define arbitrary window and define objects
- Transform window to canonical region
- Do other things (we'll see clipping latter)
- Transform canonical to screen space
- Draw it.

- All lines in direction $\mathbf{d}$ converge to same point in the image plane -- the vanishing point
- Every point in plane is a v.p. for some set of lines
- Lines parallel to image plane $\left(d_{z}=0\right)$ vanish at infinity

## Ray Picking

- Pick object by picking point on screen

- Compute ray from pixel coordinates.

## Ray Picking

- Transform from World to Screen is:

$$
\left[\begin{array}{l}
I_{x} \\
I_{y} \\
I_{z} \\
I_{w}
\end{array}\right]=\mathbf{M}\left[\begin{array}{l}
W_{x} \\
W_{y} \\
W_{z} \\
W_{w}
\end{array}\right]
$$

- Inverse:

$$
\left[\begin{array}{l}
W_{x} \\
W_{y} \\
W_{z} \\
W_{w}
\end{array}\right]=\mathbf{M}^{-1}\left[\begin{array}{l}
I_{x} \\
I_{y} \\
I_{z} \\
I_{w}
\end{array}\right]
$$

- What $\mathbf{Z}$ value?

66

## Ray Picking

## - Recall that:

Depends on screen details,YMMV General idea should translate...

- Points at $z=-i$ stay at $z=-i$
- Points at $z=-f$ stay at $z=-f$

$$
\begin{aligned}
\mathbf{r}(t) & =\mathbf{p}+t \mathbf{d} \\
\mathbf{r}(t) & =\mathbf{a}_{w}+t\left(\mathbf{b}_{w}-\mathbf{a}_{w}\right)
\end{aligned}
$$

$$
\mathbf{a}_{s}=\left[s_{x}, s_{y},-i\right]
$$

$$
\mathbf{b}_{s}=\left[s_{x}, s_{y},-f\right]
$$

## Depth Distortion

- Recall depth distortion from perspective
- Interpolating in screen space different than in world
- Ok, for shading (mostly) Half way in world space
- Bad for texture

## Depth Distortion

## Depth Distortion

Linear equations in the $a_{i} . \quad\left(\sum_{j} h_{j} a_{j}\right) b_{i} / h_{i}-a_{i}=0 \quad \forall i$
Not invertible so add some extra constraints.

$$
\begin{equation*}
\sum_{i} a_{i}=\sum_{i} b_{i}=1 \tag{}
\end{equation*}
$$

76

## Depth Distortion

For a line: $\quad a_{1}=h_{2} b_{i} /\left(b_{1} h_{2}+h_{1} b_{2}\right)$
For a triangle: $a_{1}=h_{2} h_{3} b_{1} /\left(h_{2} h_{3} b_{1}+h_{1} h_{3} b_{2}+h_{1} h_{2} b_{3}\right)$
Obvious Permutations for other coefficients.
