## CS-I84: Computer Graphics

## Lecture \#IO: Clipping and

 Hidden SurfacesProf. James O'Brien
University of California, Berkeley

## Today

- Clipping
- Clipping to view volume
- Clipping arbitrary polygons
- Hidden Surface Removal
- Z-Buffer
- BSP Trees
- Others

## Clipping

- Stuff outside view volume should not be drawn
- Too close: obscures view

## Clipping

## - Stuff outside view volume should not be

 drawn- Too close: obscures view
- Too far:
- Complexity
- Z-buffer problems
- Too high/low/right/left:
- Memory errors
- Broken algorithms
- Complexity

## Clipping Line to Line/Plane

Line segment to be clipped
$\mathbf{x}(t)=\mathbf{a}+t(\mathbf{b}-\mathbf{a})$

Line/plane that clips it
$\hat{\mathbf{n}} \cdot \mathbf{x}-\hat{\mathbf{n}} \cdot \mathbf{r}=0$

## Clipping Line to Line/Plane

## Clipping Line to Line/Plane

## - Segment may be on

 one side$t \notin[0 \ldots 1]$

- Lines may be parallel

$\hat{\mathbf{n}} \cdot \mathbf{d}=0$

## Clipping Line to Line/Plane

$$
\begin{aligned}
& \text { Segment may be on } \\
& \text { one side } \\
& t \notin[0 \ldots 1] \\
& \text { - Lines may be } \\
& \text { parallel } \\
& \hat{\mathbf{n}} \cdot \mathbf{d}=0 \\
& |\hat{\mathbf{n}} \cdot \mathbf{d}| \leq \varepsilon \quad \text { (Recall comments about numerical issues) } \\
& \hline \hat{\mathbf{n}} \cdot \mathbf{d} \\
& \hline
\end{aligned}
$$

## Triangle Clip/Split

## Polygon Clip to Convex Domain

- Convex domain defined by collection of planes (or lines or hyper-planes)
- Planes have outward pointing normals
- Clip against each plane in turn
- Check for early/trivial rejection

## Polygon Clip to Convex Domain

## Polygon Clip to Convex Domain

${ }^{12}$

## Polygon Clip to Convex Domain

- Sutherland-Hodgman algorithm
- Basically edge walking
- Clipping done often... should be efficient
- Liang-Barsky parametric space algorithm
- See text for clipping in 4D homogenized coordinates

## General Polygon Clipping

Tuesday, October 7, 2008

## Hidden Surface Removal

- True 3D to 2D projection would put every thing overlapping into the view plane.
- We need to determine what's in front and display only that.

${ }^{16}$

## Z-Buffers

- Add extra depth channel to image
- Write Z values when writing pixels
- Test Z values before writing

17

Tuesday, October 7, 2008

## Z-Buffers

## - Benefits

- Easy to implement
- Works for most any geometric primitive
- Parallel operation in hardware
- Limitations
- Quantization and aliasing artifacts
- Overfill
- Transparency does not work well

## Z-Buffers

- Transparency requires partial sorting:

$\qquad$
$\qquad$

## A-Buffers

- Store sorted list of "fragments" at each pixel
- Draw all opaque stuff first then transparent
- Stuff behind full opacity gets ignored
- Nice for antialiasing...
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Scan-line Algorithm

- Assume polygons don't intersect
- Each time an edge is crossed determine who's on top

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Painter's Algorithm

- Sort Polygons Front-to-Back
- Draw in order
- Back-to-Front works also, but wasteful
- How to sort quickly?
- Intersecting polygons?
- Cycles?

23

## BSP-Trees

## - Binary Space Partition Trees

- Split space along planes
- Allows fast queries of some spatial relations
- Simple construction algorithm
- Select a plane as sub-tree root
- Everything on one side to one child
- Everything on the other side to other child
- Use random polygon for splitting plane
