

CS-184: Computer Graphics

Lecture #4: 2D Transformations

Prof. James O'Brien
University of California, Berkeley

V2009-F-04-1.0

Today

- 2D Transformations
 - "Primitive" Operations
 - Scale, Rotate, Shear, Flip, Translate
 - Homogenous Coordinates
 - SVD
 - Start thinking about rotations...

Introduction

- Transformation:
An operation that changes one configuration into another
- For images, shapes, *etc.*
A geometric transformation maps positions that define the object to other positions
Linear transformation means the transformation is defined by a linear function... which is what matrices are good for.

3

Some Examples

Original

4

Mapping Function

$f(\mathbf{p}) = \mathbf{p}'$ Maps points in original image $\mathbf{p} = (x, y)$ to point in transformed image $\mathbf{p}' = (x', y')$

6

Mapping Function

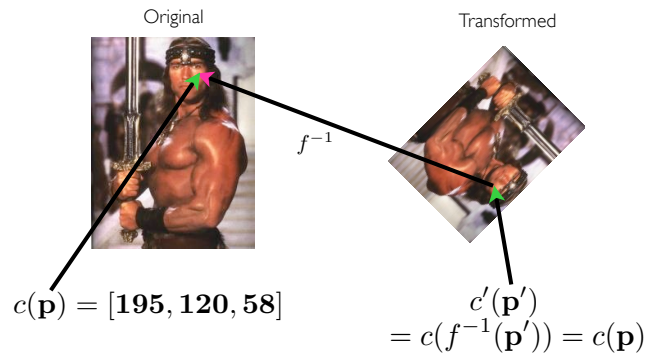

$f(\mathbf{p}) = \mathbf{p}'$ Maps points in original image $\mathbf{p} = (x, y)$ to point in transformed image $\mathbf{p}' = (x', y')$

6

Mapping Function

$f(\mathbf{p}) = \mathbf{p}'$ Maps points in original image $\mathbf{p} = (x, y)$ to point in transformed image $\mathbf{p}' = (x', y')$

7

Linear -vs- Nonlinear

Nonlinear (swirl)

Linear (shear)

8

Geometric -vs- Color Space

Color Space Transform
(edge finding)

Linear Geometric
(flip)

9

Instancing

M.C. Escher, from Ghostscript 8.0 Distribution

10

Instancing

Carlo Sequin

Instancing

- Reuse geometric descriptions
- Saves memory

Linear is Linear

- Polygons defined by points
- Edges defined by interpolation between two points
- Interior defined by interpolation between all points
- **Linear interpolation**

13

Linear is Linear

- Composing two linear function is still linear
- Transform polygon by transforming vertices

Scale

14

Linear is Linear

- Composing two linear function is still linear
- Transform polygon by transforming vertices

$$f(x) = a + bx \quad g(f) = c + df$$

$$g(x) = c + df(x) = c + ad + bdx$$

$$g(x) = a' + b'x$$

15

Points in Space

- Represent point in space by vector in \mathbf{R}^n
 - Relative to some origin!
 - Relative to some coordinate axes!
- Later we'll add something extra...

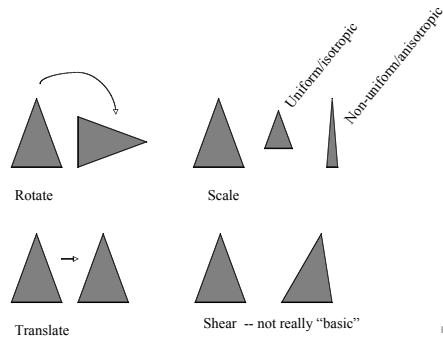

16

Monday, September 5, 11

Basic Transformations

- Basic transforms are: rotate, scale, and translate
- Shear is a composite transformation!

Linear Functions in 2D

$$x' = f(x, y) = c_1 + c_2x + c_3y$$

$$y' = f(x, y) = d_1 + d_2x + d_3y$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} t_x \\ t_y \end{bmatrix} + \begin{bmatrix} M_{xx} & M_{xy} \\ M_{yx} & M_{yy} \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix}$$

$$\mathbf{x}' = \mathbf{t} + \mathbf{M} \cdot \mathbf{x}$$

18

Rotations

Rotate

$$\mathbf{p}' = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix} \mathbf{p}$$

Rotations

- Rotations are positive counter-clockwise
- Consistent w/ right-hand rule
- Don't be different...
- Note:
 - rotate by zero degrees give identity
 - rotations are modulo 360 (or 2π)

Rotations

- Preserve lengths and distance to origin
- Rotation matrices are orthonormal
- **Det(\mathbf{R}) = 1 \neq -1**
- In 2D rotations commute...
 - But in 3D they won't!

Scales

$$\mathbf{p}' = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix} \mathbf{p}$$

Scale

Monday, September 5, 11

Scales

- Diagonal matrices
 - Diagonal parts are scale in X and scale in Y directions
 - Negative values flip
 - Two negatives make a positive (180 deg. rotation)
 - Really, axis-aligned scales

Shears

$$\mathbf{p}' = \begin{bmatrix} 1 & H_{yx} \\ H_{xy} & 1 \end{bmatrix} \mathbf{p}$$

Shears

- Shears are not really primitive transforms
- Related to non-axis-aligned scales
- More shortly,....

25

Translation

- This is the not-so-useful way:

Translate

$$\mathbf{p}' = \mathbf{p} + \begin{bmatrix} t_x \\ t_y \end{bmatrix}$$

Note that its not like the others.

26

Arbitrary Matrices

- For everything but translations we have:

$$\mathbf{x}' = \mathbf{A} \cdot \mathbf{x}$$

- Soon, translations will be assimilated as well
- What does an arbitrary matrix mean?

27

Singular Value Decomposition

- For any matrix, \mathbf{A} , we can write SVD:

$$\mathbf{A} = \mathbf{Q}\mathbf{S}\mathbf{R}^T$$

where \mathbf{Q} and \mathbf{R} are orthonormal and \mathbf{S} is diagonal

- Can also write Polar Decomposition

$$\mathbf{A} = \mathbf{P}\mathbf{R}\mathbf{S}\mathbf{R}^T$$

where \mathbf{P} is also orthonormal

$$\mathbf{P} = \mathbf{Q}\mathbf{R}^T$$

28

Decomposing Matrices

- We can force **P** and **R** to have $\text{Det}=1$ so they are rotations
- Any matrix is now:
 - Rotation:Rotation:Scale:Rotation
 - See, shear is just a mix of rotations and scales

29

Composition

- Matrix multiplication composites matrices

$$\mathbf{p}' = \mathbf{B}\mathbf{A}\mathbf{p}$$

“Apply **A** to **p** and then apply **B** to that result.”

$$\mathbf{p}' = \mathbf{B}(\mathbf{A}\mathbf{p}) = (\mathbf{B}\mathbf{A})\mathbf{p} = \mathbf{C}\mathbf{p}$$

- Several translations composted to one
- Translations still left out...

$$\mathbf{p}' = \mathbf{B}(\mathbf{A}\mathbf{p} + \mathbf{t}) = \mathbf{B}\mathbf{A}\mathbf{p} + \mathbf{B}\mathbf{t} = \mathbf{C}\mathbf{p} + \mathbf{u}$$

30

Composition

- Matrix multiplication composites matrices

$$\mathbf{p}' = \mathbf{B}\mathbf{A}\mathbf{p}$$

“Apply \mathbf{A} to \mathbf{p} and then apply \mathbf{B} to that result.”

$$\mathbf{p}' = \mathbf{B}(\mathbf{A}\mathbf{p}) = (\mathbf{B}\mathbf{A})\mathbf{p} = \mathbf{C}\mathbf{p}$$

- Several translations composited to one
- Translations still left out...

$$\mathbf{p}' = \mathbf{B}(\mathbf{A}\mathbf{p} + \mathbf{t}) = \mathbf{A}\mathbf{p} + \mathbf{B}\mathbf{t} = \mathbf{C}\mathbf{p} + \mathbf{u}$$

30

Composition

Transformations built up from others

SVD builds from scale and rotations

Also build other ways

i.e. 45 deg rotation built from shears

31

Homogeneous Coordinates

- Move to one higher dimensional space

- Append a 1 at the end of the vectors

$$\mathbf{p} = \begin{bmatrix} p_x \\ p_y \end{bmatrix} \quad \tilde{\mathbf{p}} = \begin{bmatrix} p_x \\ p_y \\ 1 \end{bmatrix}$$

- For *directions* the extra coordinate is a zero

32

Homogeneous Translation

$$\tilde{\mathbf{p}}' = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} p_x \\ p_y \\ 1 \end{bmatrix}$$

$$\tilde{\mathbf{p}}' = \tilde{\mathbf{A}}\tilde{\mathbf{p}}$$

The tildes are for clarity to distinguish homogenized from non-homogenized vectors.

33

Homogeneous Others

$$\tilde{\mathbf{A}} = \begin{bmatrix} & \mathbf{A} & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Now everything looks the same...
Hence the term "homogenized!"

34

Compositing Matrices

- Rotations and scales always about the origin
- How to rotate/scale about another point?

35

Rotate About Arb. Point

- Step 1: Translate point to origin

Translate $(-C)$

36

Rotate About Arb. Point

- Step 1: Translate point to origin
- Step 2: Rotate as desired

Translate $(-C)$

Rotate (θ)

37

Rotate About Arb. Point

- Step 1: Translate point to origin
- Step 2: Rotate as desired
- Step 3: Put back where it was

Translate (-C)

Rotate (θ)

Translate (C)

38

Rotate About Arb. Point

- Step 1: Translate point to origin
- Step 2: Rotate as desired
- Step 3: Put back where it was

Translate (-C)

Rotate (θ)

Translate (C)

$$\tilde{\mathbf{p}}' = (-\mathbf{T})\mathbf{R}\mathbf{T}\tilde{\mathbf{p}} = \mathbf{A}\tilde{\mathbf{p}}$$

38

Rotate About Arb. Point

- Step 1: Translate point to origin
- Step 2: Rotate as desired
- Step 3: Put back where it was

Translate (-C)

Rotate (θ)

Translate (C)

$$\tilde{\mathbf{p}}' = (-\mathbf{T})\mathbf{R}\mathbf{T}\tilde{\mathbf{p}} = \mathbf{A}\tilde{\mathbf{p}}$$

↑
Don't negate the 1...

38

Scale About Arb. Axis

- Diagonal matrices scale about coordinate axes only:

Not axis-aligned

39

Scale About Arb. Axis

- Step 1: Translate axis to origin

40

Scale About Arb. Axis

- Step 1: Translate axis to origin
- Step 2: Rotate axis to align with one of the coordinate axes

41

Scale About Arb. Axis

- Step 1: Translate axis to origin
- Step 2: Rotate axis to align with one of the coordinate axes
- Step 3: Scale as desired

42

Scale About Arb. Axis

- Step 1: Translate axis to origin
- Step 2: Rotate axis to align with one of the coordinate axes
- Step 3: Scale as desired
- Steps 4&5: Undo 2 and 1 (reverse order)

43

Order Matters!

- The order that matrices appear in matters

$$\mathbf{A} \cdot \mathbf{B} \neq \mathbf{BA}$$

- Some special cases work, but they are special
- But matrices are associative

$$(\mathbf{A} \cdot \mathbf{B}) \cdot \mathbf{C} = \mathbf{A} \cdot (\mathbf{B} \cdot \mathbf{C})$$

- Think about efficiency when you have many points to transform...

44

Matrix Inverses

- In general: \mathbf{A}^{-1} undoes effect of \mathbf{A}
- Special cases:
 - Translation: negate t_x and t_y
 - Rotation: transpose
 - Scale: invert diagonal (axis-aligned scales)
- Others:
 - Invert matrix
 - Invert SVD matrices

45

Point Vectors / Direction Vectors

- Points in space have a **1** for the “*w*” coordinate
- What should we have for ***a* – *b***?
 - ***w* = 0**
 - Directions not the same as positions
 - Difference of positions is a direction
 - Position + direction is a position
 - Direction + direction is a direction
 - Position + position is nonsense

46

Some things Require Care

For example normals do not transform normally

$$\mathbf{M}(\mathbf{a} \times \mathbf{b}) \neq (\mathbf{M}\mathbf{a}) \times (\mathbf{M}\mathbf{b})$$

47

Some Things Require Care

For example normals transform abnormally

$$\mathbf{n}^T \mathbf{t} = 0 \quad \mathbf{t}_M = \mathbf{M} \mathbf{t} \quad \text{find } \mathbf{N} \text{ such that } \mathbf{n}_N^T \mathbf{t}_M = 0$$

48

Some Things Require Care

For example normals transform abnormally

$$\mathbf{n}^T \mathbf{t} = 0 \quad \mathbf{t}_M = \mathbf{M} \mathbf{t} \quad \text{find } \mathbf{N} \text{ such that } \mathbf{n}_N^T \mathbf{t}_M = 0$$

$$\mathbf{n}^T \mathbf{t} = \mathbf{n}^T \mathbf{I} \mathbf{t} = \mathbf{n}^T \mathbf{M}^{-1} \mathbf{M} \mathbf{t} = 0$$

49

Some Things Require Care

For example normals transform abnormally

$$\mathbf{n}^T \mathbf{t} = 0 \quad \mathbf{t}_M = \mathbf{M} \mathbf{t} \quad \text{find } \mathbf{N} \text{ such that } \mathbf{n}_N^T \mathbf{t}_M = 0$$

$$\mathbf{n}^T \mathbf{t} = \mathbf{n}^T \mathbf{I} \mathbf{t} = \mathbf{n}^T \mathbf{M}^{-1} \mathbf{M} \mathbf{t} = 0$$

$$(\mathbf{n}^T \mathbf{M}^{-1}) \mathbf{t}_M = 0$$

$$\mathbf{n}_N^T = \mathbf{n}^T \mathbf{M}^{-1}$$

50

Some Things Require Care

For example normals transform abnormally

$$\mathbf{n}^T \mathbf{t} = 0 \quad \mathbf{t}_M = \mathbf{M} \mathbf{t} \quad \text{find } \mathbf{N} \text{ such that } \mathbf{n}_N^T \mathbf{t}_M = 0$$

$$\mathbf{n}^T \mathbf{t} = \mathbf{n}^T \mathbf{I} \mathbf{t} = \mathbf{n}^T \mathbf{M}^{-1} \mathbf{M} \mathbf{t} = 0$$

$$(\mathbf{n}^T \mathbf{M}^{-1}) \mathbf{t}_M = 0$$

$$\mathbf{n}_N^T = \mathbf{n}^T \mathbf{M}^{-1}$$

$$\mathbf{n}_N = (\mathbf{n}^T \mathbf{M}^{-1})^T$$

$$\mathbf{N} = (\mathbf{M}^{-1})^T \quad \text{See book for details}$$
